

The Du Mont Type 5DAP- is a 5 1/4-inch diameter, single beam, electrostatic focus and deflection cathode-ray tube. The focusing electrode draws negligible electron current. The tube features a linear post accelerator – a spiral resistance winding – which extends from the tube face to the deflection plate region, allowing for a gradual voltage gradient. Other features of the 5DAP- are high deflection sensitivities, high writing rates, and a pattern adjustment electrode to minimize pattern distortion. An astigmatism electrode is provided to allow for optimum spot shape adjustment.

For maximum brightness and stability in performance, all screens are provided with a highly-reflective metal backing.

GENERAL CHARACTERISTICS

Electrical Data

Focusing Method				Electrostatic

NOTES

- 1. This tube is designed for optimum performance when operating at a ratio of 8.5. Operation at other ratios may result in changes in deflection uniformity, pattern distortion and/or useful scan.
- The pattern adjustment electrode should be adjusted for optimum performance. For any neces-2. sary adjustment, its potential will be within a range of -90 to +60 volts with respect to the mean D1D2 plate potential.
- 3. Adjustment of the deflection plate shield voltage provides improved linearity of D3D4 deflection. For any necessary adjustment. Its potential should not exceed ± 20 volts with respect to the mean D3D4 plate potential.
- 4. The astigmatism electrode should be adjusted for optimum spot shape. For any necessary adjustment, its potential will not exceed ± 100 volts with respect to the accelerator voltage.
- 5. Visual extinction of the undeflected, focused spot.
- 6. For a beam current of 25 µADC, measured in accordance with MIL-E-1 specifications. All readings of beam current shall be in addition to the reading obtained for post accelerator current with beam cut-off.

DE-6104

NOTES (Continued)

- 7. All portions of a raster pattern adjusted so its widest points just touch the sides of a 4.052 x 2.032-inch rectangle (centered horizontally with respect to the tube face) will fall within the area bounded by this rectangle and an inscribed 3.94 x 1.97-inch rectangle.
- 8. For a beam current of 25 µADC, measured in accordance with MIL-E-1 specifications. All readings of beam current shall be in addition to the reading obtained for post accelerator current with beam cut-off.
- 9. The gun efficiency is the ratio of the beam current to the cathode current.
- 10. The undeflected and focused spot shall fall within a 9×19 -mm rectangle centered with respect to the tube face center. The 19-mm dimension shall be in the D1D2 scan direction.
- 11. Measured with a Type 3 Photronic Cell, corrected for spectral response of the eye, using a 1.5×1.5 -inch, 50-line raster, with 1.5×1.5 -inch, 1.5×1.5 -
- 12. Measured with a Type 3 Photronic Cell, without eye correction, using a 1.5 x 1.5-inch, 50-line raster, with $1b3 = 25 \mu A$.
- 13. Measured with Grid No. 1 at cut-off. Post accelerator current is the current flowing through the post accelerator resistance which is connected between the post accelerator and pattern adjustment electrode.
- 14. With the D1D2 scan reversed (D1D2 scanning vertically, D3D4 scanning horizontally), the raster adjusted for best overall focus, and Ib3 at 25 µA, the line width anywhere within the minimum useful scan shall not exceed .050 inch.
- 15. It is recommended that the deflecting-electrode circuit resistances be approximately equal. Higher resistance values up to five meaghms may be used for low beam current operation.
