

GL-6808

## THYRATRON

### TRIODE TYPE

## QUICK-HEATING CATHODE

### DESCRIPTION AND RATING

The GL-6808 is a three-electrode, inert-gas-filled thyratron with a negative control characteristic for all control applications. This tube combines the desirable temperature characteristic of gas tubes, maximum ratings over a wide temperature range, with the long life of mercury tubes. Another feature useful in industrial applications is the quick-heating cathode which requires only one minute to reach operating temperature.

The GL-6808 is equipped with a bracket-type base for panel mounting.

## TECHNICAL INFORMATION

## GENERAL

Electrical		Minimum	Bogey	Maximum	
Cathode* - Filamentary					
Filament Voltage . . . . .	2.37	2.5	2.63	Volts	
Filament Current at 2.5 Volts . . .	---	21	23	Amperes	
Heating Time . . . . .	60	---	---	Seconds	
Anode to Control-Grid					
Capacitance . . . . .	---	10	---	$\mu\text{uf}$	
Control-Grid to Cathode					
Capacitance . . . . .	---	10	---	$\mu\text{uf}$	
Deionization Time, approximate					
$E_C = -250$ volts . . . . .	---	100	---	Microseconds	
$E_C = -12$ volts . . . . .	---	700	---	Microseconds	
Ionization Time, approximate . . . . .	---	10	---	Microseconds	
Anode Voltage Drop . . . . .	---	16	---	Volts	
Critical Grid Current, $E_p = 200$ volts a-c . . . . .	---	---	10	Microamperes	
Control Characteristics					
Anode Voltage 60 100 1000 . . . . .	. . . . .	. . . . .	. . . . .	Volts	
Grid Voltage +6 0 -7 . . . . .	. . . . .	. . . . .	. . . . .	Volts	

## Mechanical

### Type of Cooling - Convection

Mounting Position = Any

Net Weight, maximum 12 Quinces

The anode and grid-circuit returns should be made to the center tap of the filament transformer.

from JETEC release #1639, May 7, 1956

MAXIMUM RATINGS, Absolute Values

Maximum Peak Anode Voltage			
Inverse . . . . .	1500	Volts	
Forward . . . . .	1500	Volts	
Maximum Cathode Current			
Peak . . . . .	80	Amperes	
Average . . . . .	6.4	Amperes	
Maximum Averaging Time . . . . .	15	Seconds	
Fault . . . . .	1120	Amperes	
Maximum Duration . . . . .	0.1	Seconds	
Maximum Negative Control-Grid Voltage			
Before Conduction . . . . .	250	Volts	
During Conduction . . . . .	10	Volts	
Maximum Positive Control-Grid Current			
Anode Positive . . . . .	0.20	Amperes	
Anode Negative . . . . .	0.10	Amperes	
Commutation Factor <sup>f</sup> . . . . .	130		
Ambient Temperature Limits . . . . .	-55 to +70	C	

Most satisfactory performance and life will result with quadrature filament operation, i.e., with the filament voltage 90 degrees out of phase with the anode voltage. When quadrature operation is used the voltage on the filament lead (lead No. 2) adjacent to the grid lead (lead No. 1) should be crossing zero from positive toward negative when the anode voltage is at the peak of the positive half cycle.

In three-phase systems each tube should be connected so that its anode and filament voltages approximate as nearly as possible the quadrature phasing, i.e., filament voltage 90 plus or minus 30 degrees out of phase with the anode voltage.

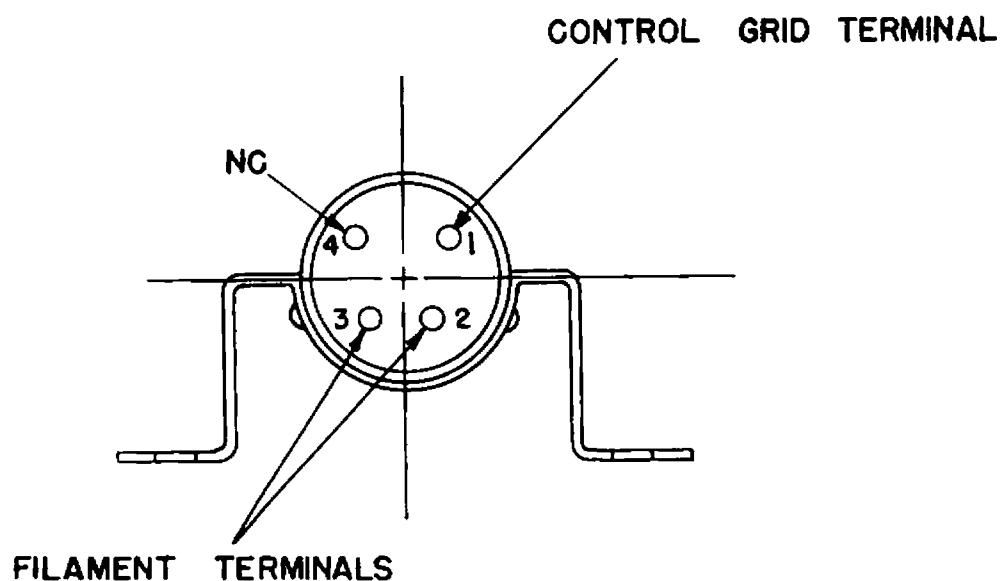

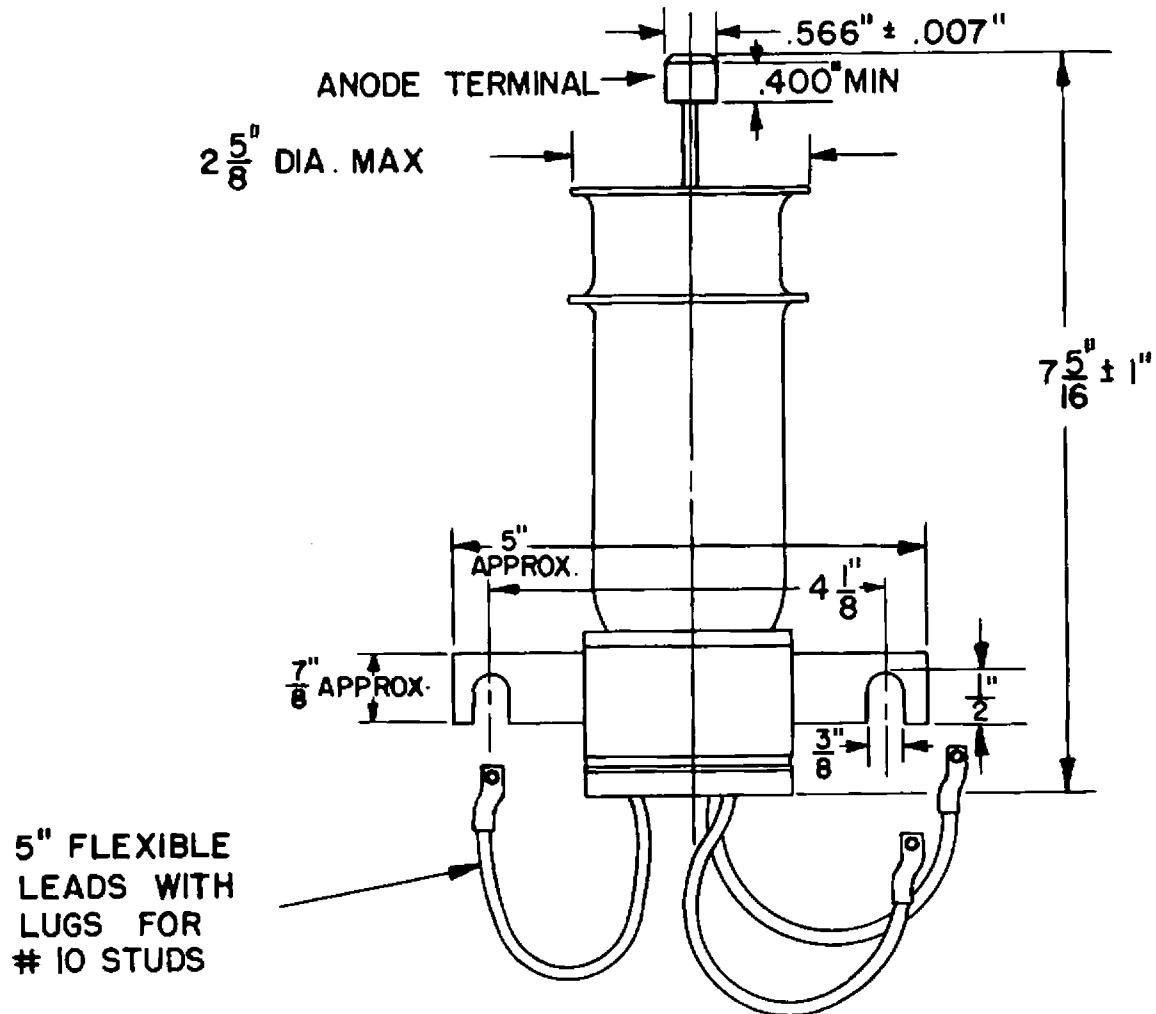

When quadrature operation is not practicable, filament lead No. 2 should be negative when the anode is positive.

<sup>f</sup> Commutation factor is the product of the rate of current decay in amperes-per microsecond just prior to commutation, and the rate of inverse voltage rise in volts-per-microsecond just after commutation.
